

Ticket ID	Alert Message	Severity	Details	Ticket status
A-2703	SERVER-MAIL Phishing attempt possible download of malware	Medium	The user may have opened a malicious email and opened attachments or clicked links.	Investigating ▾

Ticket comments
- The initial evaluation classifies this as a medium-severity alert related to a potential phishing attempt. The user's interaction with the suspicious email is concerning. - The email, described in the Additional Information, came from an unverified sender and included a password-protected attachment. Although the message itself didn't show obvious phishing signs, the attachment was confirmed to be malicious based on a known file hash. - The activity timeline shows that the user opened the attachment, which may have executed a malicious payload on their system. - The verified malicious hash is 54e6ea47eb04634d3e87fd7787e2136ccfbcc80ade34f246a12cf93bab527f6b, confirming the file's threat. - The combination of the unverified sender, password-protected attachment, and user interaction increases suspicion and warrants deeper investigation. - This alert is being escalated to assess the possible impact and determine any necessary remediation steps.

Additional information

Known malicious file hash:

54e6ea47eb04634d3e87fd7787e2136ccfbcc80ade34f246a12cf93bab527f6b
